

Influence of Current Density Upon the Electric SOV/163-59-1-11/50
Conductivity of the System Carbon Electrode-Kryolithe Melt-Dissolved Aluminum

serving as an anode and the inside electrode (carrying no current load), and between the anode and the graphite crucible serving as a cathode. The experiments showed that the variation of the electric conductivity of the system anode-electrolyte-dissolved metal differs from that of the system without metal if the current density at the anode is increased. In both cases, however, deviations from the monotonous course of the curves were found at current densities of 0.1, 0.3, and 0.9 amps/cm². In the range of 0 to 1.1 amps/cm² the electric conductivity drops by 80 %. When the conductivity was measured between the anode and the cathode, a similar relationship was found, with only the difference that the conductivity decreases much more rapidly if the current is switched on. The graphite electrodes were replaced by metal electrodes (of heat resisting steel) as to solve the problem whether the material of the electrodes influences the nature of the conductivity versus current density function, and whether the rules found to govern the behaviour of graphite electrodes are specific only to them. The results of the investigation show that in this case the conductivity varies as the current

Card 2/3

Influence of Current Density Upon the Electric SOV/163-59-1-11/50
Conductivity of the System Carbon Electrode-Kryolithe Melt-Dissolved Aluminum

density. If a metal is introduced into a system with a metal electrode, this relationship becomes reciprocal. The experiments showed that the complicated nature of the course taken by the conductivity versus current density function in the system electrode-electrolyte and electrode- electrolyte- dissolved metal is determined by the processes occurring in the carbon anode. A comparison of the results of the present paper with those from earlier papers (Refs 3-7) lead to the conclusion, that the pronounced variations of conductivity at current densities of 0.1, 0.3, and 0.9 amps/cm² are connected with the interaction of carbon and oxygen. There are 3 figures and 8 Soviet references.

TITLE: Relation of the Quantity of "Carbon Foam" in a Cryolite-alumina Melt to Current Density at the Anode (Zavisimost' kolichestva "ugol'noy peny" v kriolit-glinozemnom rasplave ot anodnoy plotnosti toka)

PERIODICAL: Izv. vyssh. uchebn. zavedeniy. Tsvetn. metallurgiya, 1958, Nr 1, pp 107-115

ABSTRACT: When the anode cd in the baths is increased, the change in the nature of the process at the anode results in a change in the amount of carbon fines coming down at the anode to form "carbon foam". Investigations conducted with laboratory equipment (in a cylindrical graphite crucible) show that foam formation starts at $cd=0.3$ amps/cm² and increases sharply at $cd=0.9$ amps/cm². The presence of dissolved metal in the electrolyte reduces anode losses and changes the nature of the relationship. Anode losses for anode pastes of various compositions are investigated. They depend upon the composition of the paste and the conditions used in baking the carboniferous

Card 1/2

Relation of the Quantity of "Carbon Foam" (cont.)

material. There are cd (0.6-1.0 amps/cm²) at which a sharp rise in the amount of foam is observed. This requires that experiments be performed in an industrial cell to determine the cd at which foam formation will be smallest.

PERIODICAL: Tsvetnyye Metally, 1958, Nr 12, pp 56 - 60 (USSR)

ABSTRACT: The authors draw attention to the discrepancies in the literature on the effects of fluorides on the electrical conductivity of aluminium electrolytes, some authors (Refs 1, 2) stating that the effect is positive, others (Refs 4, 5) that it is negative. They outline the results of their study in which B.M. Khamzin and Ya.A. Sal'nikov participated, of the influence of CaF_2 and MgF_2 on the conductivity of the system: carbon electrode - cryolite melt - dissolved aluminium, or without the last component. As they had previously indicated (Refs 6, 7), results with such systems are more applicable to practice than those obtained with the "pure" electrolyte. A Kohlrausch bridge with a type ZG-10 sonic-frequency was used, the null point

Card 1/3

SOV/136-58-12-12/22

Influence of CaF_2 and MgF_2 on the Electrical Conductivity of the System "Carbon Electrode - Cryolite Melt - Dissolved Aluminium"

being found with the aid of a piezo-electric telephone. The measuring device was made of graphite. The experiments were carried out in a Silit furnace with automatic temperature regulation with an MRSHchPR-54 millivoltmeter and a chromel-alumel thermocouple. It was found that for the system "graphite electrode - cryolite melt" the addition of 7-9% CaF_2 increases the conductivity but further additions reduce it (line 1 in Figure 1); with the system including dissolved aluminium it does not change up to a certain concentration of CaF_2 (line 2 in Figure 1), which depends on the cryolite ratio and above which the conductivity decreases. Addition of MgF_2 to the aluminium-less system for cryolite ratios below 2.5 reduce the conductivity linearly; for higher ratios the conductivity passes through a minimum at 5-6% MgF_2 . With aluminium

Card 2/3

SOV/136-58-12-12/22

Influence of CaF_2 and MgF_2 on the Electrical Conductivity of the System "Carbon Electrode - Cryolite Melt - Dissolved Aluminium"

there is a linear decrease in conductivity with increasing MgF_2 contents for all cryolite ratios.

TITLE: Extraction of sulphur into the solution during the leaching of bauxites by Bayer's method. (Izvlechenie sery v rastvor pri vyshchelachivanii boksitov po sposobu Bayera.)
PERIODICAL: "Tsvetnye Metally" (Non-ferrous Metals) 1957, No.4, pp. 49 - 51 (U.S.S.R.)

ABSTRACT: The accumulation of sulphur in the aluminate solution in the leaching of bauxites leads to increased irreversible losses of alkali and can have a deleterious effect on the decomposition and other aspects of the process. In this article an account is given of the study of the kinetics of sulphur extraction into the solution during leaching of bauxite by Bayer's method and the influence on it of various factors. The leaching was carried out in 80 ml laboratory autoclaves, the aluminate solutions containing from 120-137 g/litre Al_2O_3 and from 326-335 g/litre of $\text{Na}_2\text{O}_{\text{total}}$. In all experiments the leaching was carried out on diasporic bauxites containing 50.0 - 55.3% Al_2O_3 and 0.25 - 1.9% S, the bauxites being ground to 75% through 270mesh. Lime was added to activate the leaching, and all experiments were carried out at 200 - 205 °C. The extraction of sulphur is plotted against the duration of

Card 1/2

Extraction of sulphur into the solution during the leaching
of bauxites by Bayer's method. (Cont.) 136-4-10/23

leaching for various conditions and against the silica content
in the bauxite. The experiments were carried out under
conditions rather similar to those prevailing in practice and
the results are considered to give a useful indication of the
influence of the sulphur content in the bauxite and in the
alumina solution taking part in the leaching on the degree of
extraction of sulphur. As regards the influence of silica it
is suggested that the sulphide sulphur extracted from the
bauxite reacts chemically with the silica to form compounds
only slightly soluble under the conditions of the leaching
process. There are 2 figures.

TITLE: The Nature of Electrolytic Oxidation of the Carbon Anode
in Cryolite/Alumina Melts and Its Effect on the
Electrical Conductivity of the System (Vliyaniye kharaktera
elektroliticheskogo okisleniya uglerodistogo anoda v
kriolito-glinozemnykh rasplavakh na yego elektroprovodnost')
PERIODICAL: Izvestiya Vysshikh Uchebnykh Zavedeniy, Tsvetnaya
Metallurgiya, 1958, Nr 5, pp 62 - 68 (USSR)
ABSTRACT: The object of the present investigations was to study the variation of the electrical conductivity of the systems carbon anode/cryolite + alumina, and carbon anode/cryolite + alumina/metalllic aluminium, which were polarised by a DC current so as to obtain data on the optimum current density in electrolytic extraction of aluminium. The conductivity measurements were carried out with the aid of a modified version of a resistance bridge described by Abramov and Vetyukov (Ref 10) which made it possible to reduce to minimum the effects of the inductive and self-capacitance coupling on the experimental results. A sketch of the apparatus used and the circuit diagram
Card1/6

SOV/149-58-5-7/18

The Nature of Electrolytic Oxidation of the Carbon Anode in

of the System

are reproduced in Figure 1. The experimental conditions were similar to those employed by the authors in their earlier investigations (Refs 8, 9). A graphite crucible constituted the cathode (Detail 7, Figure 1) and in addition to the current-carrying, graphite anode (Detail 6, Figure 1) there was an inner, concentric with it, unloaded, graphite electrode (Detail 5, Figure 1). The experiments consisted of measuring the conductivity between (a) the anode and the inner electrode and, (b) the anode and the cathode under various conditions of the current density, electrolyte composition (the molecular NaF/AlF₃ ratio), with and without the presence of metallic aluminium. Two measurements were made at each value of the current density: one with the DC current on and one immediately after the current was switched off. (Before switching off the current, the anode was polarised for 3 minutes.) Since the shape of the curve showing the relationship between the conductivity of the system and the current density was not affected by the NaF/AlF₃ ratio

Card2/6

The Nature of Electrolytic Oxidation of the Carbon Anode in

of the System

SOV/149-58-5-7/18

of the electrolyte, the results reproduced in the present report are based on the mean values of the data obtained for various experimental compositions of the electrolyte. The variation of the electrical conductivity of the system graphite electrode/cryolite with the current density is illustrated in Figure 2 (graph 1 - current on, graph 2 - current off). In Figure 4, the experimental results for the systems graphite anode/cryolite/metalllic aluminium and graphite anode/cryolite (graphs 1 and 2 respectively) are compared with those calculated from the data obtained by Antipin in the course of another investigation (graph 3). It is shown that in the presence of metallic aluminium the variation of conductivity of the system with the current density is markedly altered. The results of the measurements in the system anode/electrolyte/metalllic aluminium are reproduced in Figure 4 (graph 1 - current on, graph 2 - current off). Within the current density range Card 3/6 0 - 0.3 A/cm² the conductivity of the system decreased

SOV/149-58-5-7/18

The Nature of Electrolytic Oxidation of the Carbon Anode in
Cryolite-Alumina Melts and Its Effect on the Electrical Conductivity
of the System

slowly. At 0.3 A/cm^2 there was a sudden drop in conductivity which then continued to decrease (at a slower rate) with increasing current density. Although the variation of the conductivity of the system graphite electrode/electrolyte/dissolved aluminium was different from that observed in the system graphite electrode/electrolyte, in both cases the relationship conductivity/current density deviated from monotonic at 0.1 , 0.3 and 0.9 A/cm^2 . For any current density the conductivity was higher when no current was passing through the system. The total decrease of conductivity within the $0 - 1.1 \text{ A/cm}^2$ current-density range amounted to 80%. Conductivity measured between the anode and the cathode varied in the same manner, except that with the current on, it decreased more rapidly with the increasing current density. To check whether the studied relationship was affected by the anode material, the variation of conductivity of the systems heat-resistant steel/electrolyte and steel/electrolyte/metallic aluminium was also determined, the

Card4/6

SOV/149-58-5-7/18

The Nature of Electrolytic Oxidation of the Carbon Anode in
Cryolite-Alumina Melts and Its Effect on the Electrical Conductivity
of the System

results being reproduced in Figure 5. In both cases, linear variation of conductivity was observed. In the steel/electrolyte system it increased with the increasing current density, while in the presence of metallic aluminium it decreased. This proved that the variation of conductivity observed in the systems incorporating graphite anodes was confined to the anodes and that - as had been postulated before (Refs 1, 7, 11) - the changes of conductivity occurring at the characteristic values of the current density (0.1, 0.3 and 0.9 A/cm²) are caused by the action of anodic oxygen (the interesting fact is that presence of oxygen in the lattice of the graphite anode results in an increase in conductivity in the 0 - 0.3 A/cm² current density range). The minimum on the conductivity curve at 0.9 A/cm² is attributed to a high concentration of the carbon particles in the

Card5/6

SOV/149-58-5-7/18
The Nature of Electrolytic Oxidation of the Carbon Anode in
Cryolite-Alumina Melts and Its Effect on the Electrical Conductivity
of the System

immediate neighbourhood of the anode; at higher current densities these particles become distributed uniformly throughout the electrolyte and the conductivity of the system increases. It is postulated that the change in the conductivity/current density relationship in the presence of metallic aluminium is associated with the interaction between lower valency cations (Al^+ and Na_2^+) with the oxygen chemisorbed on the carbon surface.

Title : Use of Reactance Tube To Control the Frequency of Vacuum-Tube Oscillator

Orig Pub : Elekstrostroyaz', 1956, No 8, 3-17

Abstract : Discussion of the problem of the limiting frequency deviation in a vacuum-tube oscillator, obtainable with the aid of a reactance tube. The connection between the frequency deviation and the depth of the parasitic amplitude modulation is established. In one version of a circuit for connecting the reactance tube to the oscillator tank circuit it is possible to reduce considerably the parasitic amplitude modulation, compared with the usual circuit, over a wide range of oscillator frequency variation. Calculations made with the derived equations are compared with experimental data.

Calculation of Impulse Duration of a Phantastron

PERIODICAL: Radiotekhnika, 1960, Vol 15, Nr 3, pp 75-77 (USSR)

ABSTRACT: The purpose of the paper is to determine analytical relationships between the control voltage E_0 and the duration of the output impulse T_u in the phantastron circuit given in Fig. 1.

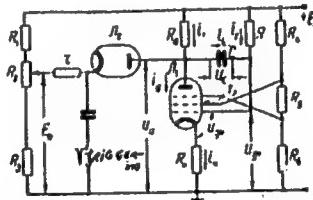

FIG. 1.

Card 1/4

Calculation of Impulse Duration of a
Phantastron

78151
SOV/108-15-3-14/17

The voltage u_a is given by

$$u_a = [E_0 - \Delta U_{al} + (\kappa' - 1) E_a + \kappa' E_{go}] e^{-\frac{t}{\tau_e}} - (\kappa' - 1) E_a - \kappa' E_{go}, \quad (II).$$

where $\kappa' = \frac{R_a S}{1 + (S + S_e) R_a}$ and $\tau_e = RC \left[1 + \kappa' + \frac{R_a}{R} \right]$

ΔU_{al} is voltage jump at the anode at the start of operation; S and S_e are steepnesses of anode and screen currents, respectively; and E_{go} is the cutoff voltage of the first grid. Figure 2 gives the voltage shape on the anode of the phantastron.

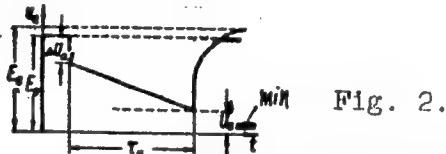

Fig. 2.

Card 2/4

Calculation of Impulse Duration of a
Phantastron

78151
SOV/108-15-3-14/17

When $\tau_u \ll T_e$, τ_u becomes

$$\tau_u = \tau_e \frac{E_a - \Delta U_{a1} - U_{a\min}}{E_a - \Delta U_{a1} + (\kappa' - 1) E_a + \kappa' E_{g0}}. \quad (13)$$

which can be further simplified into

$$\tau_u \approx RC \frac{E_a - \Delta U_{a1} - U_{a\min}}{E_a}. \quad (14)$$

when only the order of magnitude of the impulse duration is looked for. In Eqs. (13) and (14), $U_{a\min}$ is given by

$$U_{a\min} = E_a - i_{1_{Hilc}} R_a.$$

The voltage jump at the anode at the start of operation ΔU_{a1} may be calculated from

$$\Delta U_{a1} = \frac{\kappa' R (E_{g0} + U_{an}) + RE_a + R_{-}U_{an} - (R + R_a) E_a}{(\kappa' + 1) R + R_a}. \quad (19)$$

Phantastrons; theory, planning and design (Fantastronnyye generatory; teoriya, proyektirovaniye, raschet) Moscow, Izd-vo "Sovetskoye radio", 65. 0174 p. illus., biblio. 12,800 copies printed.

TOPIC TAGS: phantastron, transistorized generator

PURPOSE AND COVERAGE: A description and analysis of phantastrons is given, the basic design relations characterizing the operation of pulsed generators of the phantastron type are presented, and the principles of the design of phantastrons of electric vacuum and semiconductor devices are discussed. The material of the book is illustrated with numerical examples. Two appendices present families of static characteristics of tubes and transistors used in phantastrons. The book is intended for students of radio engineering schools and also for a wide range of specialists in the field of radio electronics. The author thanks professor Gets Aronovich Levin and docent candidate of technical sciences Sergey Ivanovich Kaplin for reading the manuscript and making valuable comments. The author also thanks docent candidate of technical sciences Nikolay Aleksandrovich Suslov for taking part in the composition of the book layout.

TITLE: In Search of Something New (V poiskakh novogo)

PERIODICAL: Vestnik Vozdushnogo Flota, Nr 10, 1957, pp. 61 - 65 (USSR)

ABSTRACT: In this article the author describes an attack of a fighter two-ship element against the bomber flight in the stratosphere, performed in echelon formation, and the procedure of development of a new combat formation of a fighter two-ship element and flight for the attack against the enemy bombers flying at high speeds and altitudes. A new combat formation of a fighter two-ship element and flight, the so-called "arrow formation" (strela samoletov), was developed by Fighter Pilots A.G. Bobrov and K.G. Pavlov. This combat formation permits the fighter pilots to concentrate more attention on the target search and circumspection. The article contains no technical data.

TITLE: Lessons Learned From a Tactical-Flight Exercise (Uroki odnogo letno-takticheskogo ucheniya)

PERIODICAL: Vestnik vozdushnogo flota, 1958, Nr 11, pp 20-25 (USSR)

ABSTRACT: In this article the author makes a critical examination of a tactical-flight exercise that was carried out in a bomber unit. The author states that tactical-flight exercises are the highest form of combat training for flying personnel of subunits. After a detailed analysis of many shortcomings, the author arrives at the conclusion that good results can be expected only when the exercises are carried out under conditions as close as possible to actual combat conditions and when due consideration is paid to the importance of the tactical element.

PHASE I BOOK EXPLOITATION

SOV/1190

• *Vestnik vozduzhnogo flota*

Vozdushnyy boy pary i zvena istrebiteley (Aerial Combat of Fighter Planes in Pairs and Flights) Moscow, Oborongiz, 1958. 126 p. No. of copies printed not given.

Compilers: Yakushin, M.N., Maj Gen of Aviation, and Vazhin, F.A., Lt Col; Ed.: Gavrilov, N.N., Lt Col; Tech. Ed.: Myasnikova, T.F.

PURPOSE: The book is intended for fighter pilots of aviation units and aviation schools, and may also prove useful to reserve pilots, aeroclub flying personnel, and the general reader.

COVERAGE: The articles selected by the editors for this book were previously published in the periodical *Vestnik vozduzhnogo flota*, 1955-1957. They reflect the personal views of the respective authors on practical methods of conducting aerial combats in pair and flight formations of fighter planes

Card ~~1~~

at all altitudes up to service ceiling under ordinary and adverse weather conditions, by day and by night. The articles analyze maneuvers of pair and flight formations of fighter planes in searching and approaching targets, and they deal with the attack itself and final withdrawal. Tactics of attack at various speeds, on approaching courses, and methods of intercepting the enemy with the aid of radiotechnical location and sighting equipment are described. No personalities are mentioned. There are no bibliographic references.

TITLE:

Synchronous Condensers for Long-Distance Transmission Systems
(Sinkhronnyye kompensatory dlya dal'nikh elektroperedach)

PERIODICAL:

Elektrичество, 1958, Nr 10, pp 43 - 47 (USSR)

ABSTRACT:

This is a study of problems of design of synchronous condensers connected with the elimination of self-excitation of such generators in various modes of operation. Inasmuch the investigation of two boundary cases of damper system design is of interest, that is to say, of a normal design and of a connected type of winding, this paper is limited to compensators with salient poles with only one type of rotor. The computations presented in this paper demonstrate that non-compensated supporting condensers, which are intended for continuous duty at rated power with lagging current can be built on

Card 1/3

Synchronous Condensers for Long-Distance Transmission Systems

SOV/105-58-10-10/28

the basis of conventional machines with very high power (75 MVA). In order to be able to obtain a considerable output with leading current, the compensator must operate with negative excitation currents. 2) A supporting synchronous condenser which is compensated for capacity can be designed on the basis of normal condensers. 3) Compensated supporting condensers can be continuously operated at rated power with lagging and with leading current. 4) In order to guarantee a forced excitation of non-compensated supporting synchronous condensers an increased ceiling voltage of excitation is required. In compensated condensers a similar behaviour is guaranteed by normal exciters. There are 4 figures, 2 tables, and 5 references, 4 of which are Soviet.

TITLE:

Method of Investigating Dynamic Stability on Analog Computers ^b

PERIODICAL: Elektrichestvo, 1960, Nr 4, pp 7 - 12 (USSR)

TEXT: The description of characteristics for the investigation of transients in 2 synchronous machines (Fig 1) working parallel to a net of infinite output over punctiformly distributed resistors is the purpose of the paper under review. It is assumed that the influence of the effective resistance of the stator circuits, and the transients caused by these resistances can be neglected. Synchronous machines with non-salient poles, with 2 symmetrical windings on the d- and q-axis, with a nonsaturated magnetic circuit, and controllable excitation are investigated. A number of successive modes of operation of the power network must be investigated to solve the problems of dynamic stability on an analog computer. The characteristics of these problems are indicated here. Formulas (1) to (10) written down under the above mentioned assumptions show that the structure of these formulas remains about the same for various modes of operation. It is therefore sufficient to set up the differential equations only for one mode of operation before the disturbance. The transition to short

Card 1/3

B007/B008

circuit and to the mode of operation after the disturbance is achieved by switching over, or switching off, respectively, the corresponding inlets and outlets of the circuit-scheme elements. Various time scales must be used in order to reproduce the various modes of operation with sufficient accuracy. A linear relation exists between the variables of the machine and the actual values when solving problems on computers. A nonlinear relation may also occur in a number of cases. In these cases it is not the proportionality factor of the variables of the machine and of the actual variables which forms the variable scale, but the proportionality factor of their differentials. The variable time scale is realized technically by connecting a relay group to the solution circuit. The contacts of these relays connect additional resistors to the inlets of the integrators, or cause a shunt of the relays. It is shown how to obtain sine-cosine functions for a wide range of argument variation. The characteristics for the solution of problems of dynamic stability with slight fading are investigated. It is shown that the smaller the fading in the power network to be simulated, the greater the error developing because of exterior and interior disturbances in the circuit scheme. The problem of selection of the multiplier type when solving the problems of dynamic stability is investigated. It is shown that a combination of electronic and electromechanic

Card 2/3

69944

Method of Investigating Dynamic Stability on
Analog Computers

S/105/60/000/04/002/024
B007/B008

multipliers must be used for these problems. The methods of checking the correctness of the solution of problems of dynamic stability are investigated. The most correct and most suitable checking of transients is the solution of the problem on various time scales. Problems of dynamic stability of a synchronous generator were successfully solved on the analog computer developed at the LPI im. Kalinina (Leningrad Polytechnic Institute imeni Kalinina) under the direction of Professor T. N. Sokolov with the aid of the method given here. There are 4 figures and 5 Soviet references. ✓
